of digital HD Radio™
into the home.

Receptor Radio® HD
The world's first table HD Radio

Hearing the Receptor Radio® HD for the first time, you will be stunned. First, by the incredibly powerful, room-filling sound from a tabletop radio this small. Then, by the spectacularly brilliant clarity and fidelity never before heard from any radio of any size. Welcome to digital HD Radio™ broadcast technology and a new world of absolutely pristine AM and FM sound. And, to a boundless future of exciting, new entertainment and informational possibilities.

Radio with CD-quality sound

Not since the dawn of hi-fidelity FM stereo have any innovations contributed so much to the quality and enjoyment of radio as digital HD Radio broadcasting and Boston Acoustic's Receptor Radio HD. Now, FM sounds as sensational as CDs. AM sounds as rich as today's FM.

Sound so startling clear it makes radio brand new all over again.

Signal fade, static, hiss and pops are virtually nonexistent. And, driven by the pure, natural, true-to-the-original performance™ of its speakers, the Boston Acoustics Receptor Radio HD is an astonishing, front-row-live listening experience.

For owners of the Receptor Radio HD, this new digital HD Radio technology ushers in a boundless array of new entertainment and informational possibilities. Stations can broadcast special programming information such as station call letters, song title, artist, and additional text over their same familiar position on the dial.

Receptor Radio HD is state-of-the-art today and plugged into tomorrow.

HD Radio technology is an exciting new way for AM and FM radio stations to broadcast digitally, giving listeners drastically improved sound quality, more and new programming choices, and text data in conjunction with audio programs. It is a huge leap forward over today's analog broadcasts.

Stations remain in their traditional locations on the radio dial, but they simultaneously transmit digital signals with text in addition to their main analog channels. So, analog radios continue to receive analog signals, while HD Radio receivers pick up the digital signals.

The Receptor Radio HD's advanced digital technology offers listeners crystal-clear sound, virtually eliminating static, hiss, pops, and fades common to older analog technologies.

In addition to broadcasting their main station in analog and digital formats, some stations will also offer additional digital channels, known as multicast channels – a service the Receptor Radio HD plays seamlessly. And, it can even display RBDS station information for non-digital broadcasts. Receptor Radio HD sorts it all out to bring you your favorite current programming and new and expanding choices. All with a clarity you've never experienced before. And, it's all FREE! Just like today's analog AM and FM, HD Radio comes to you without any subscription fees. All you need is the Receptor Radio HD.

Radio that keeps on expanding

Beyond Receptor Radio HD's astonishing sound are a host of other features that add to your convenience and enjoyment.

An iPod®/MP3 player port invites you to share your favorite tunes with friends over speakers that truly do sound closer to the original performance. A headphone jack line-out lets you listen to digital HD Radio without disturbing others.

Remarkably easy-to-use features

The Receptor Radio HD is exceptionally intuitive to use. Remotely or manually, you easily control tuning, volume and presetting up to 20 of your favorite stations. A sleep feature lets you fall asleep to music while two independent alarms wake you to music, beeper, or both. Settings are easily stored with top panel buttons.

Recepter Radio® HD Specifications**The Boston Sound™**

Listening to a Boston system is an audio experience more like a live concert than a recording. It is the sound the artist intended. Pure, natural, true-to-the-original performance.™ The Boston Sound.

It is the sound recognized for its smooth, octave-to-octave tonal balance from the deepest bass to the highest treble. It is the legendary performance distinguished as much by what it doesn't do as by what it does; not favoring one frequency over another, instead presenting the mids, highs and lows in perfect balance. It is greater detail across the entire sonic spectrum with no artificially generated coloring or distortion at high volume. And, it is the same consistent voice you hear no matter which Boston speakers you're listening to, or where.
