BOLLARD SPEAKER POOR SOIL INSTALLATION

INSTRUCTIONS

When dense clay soils exist it is best to make sure water can properly drain below the Bollard Speakers to prevent them from moving or shifting after installation.

- 1 Excavate a hole based on the size of your speaker (see below).
- 2 Fill the lower 1/3 of the hole with clean stone (1/2"-3/4") and compact with a hand tamper.
- 3 Carefully lower the speaker into the hole, making sure you allow 1" below the base of the sub grill (10.0 3-Way & 10.0 Subwoofer) or 1" below the drainage outlet (10.0 2-Way & 10.0 Subwoofer).
- 4 Backfill around the diameter of the speaker with existing soil or clean sand, compacting in 6" lifts.
