Installation Instructions

PCOR30/PMOR30 with Remote Blower

1. Remove the outer casing of the microwave.
2. Unplug the blower motor wiring connector.
3. Remove the existing blower.
4. Place the charcoal filter in place and seal it with duct tape. Also seal off the line of holes found immediately above the filter in the center of the unit. Do not seal off the slotted openings on the front sides of the product.

 **NOTE:**

Sealing the charcoal filter area will focus the ventilation action to the filters on the bottom of the unit. Failure to seal this area will allow the remote vent to draw air through the top of the unit, severely reducing effective ventilation.

5. Wire the remote blower to the ARSC remote speed control switch as instructed in the ARSC installations. It is not recommended that the remote blower be wired through the microwave.

 **NOTE:**

Remember the ILB8 is 8" round and the microwave is 3 1/4" x 10", so a transition will be required.

The ventilation power will be doubled (at least) with a reduction of 2 decibels on the high setting (even more of a sound reduction on the low settings.)
